

Protect your most valuable asset: your data

There are dozens of routes that valuable data can leave your organisation:

- 1 Via e-mail and the internet
- 2 Via your IT network
- 3 Via the laptops and portable storage devices of your employees.

There are different ways to protect or block these potential leaks of your valuable data.

- 1 You may use a sophisticated incoming and outgoing e-mail scanner
- 2 You may license effective firewall software for your network
- 3 You may implement a thorough employee policy regarding use of data.

These data security solutions are simply outdated to deal with modern threats, particularly when data is being transferred.

Data loss fact

HM Revenue and Customs was at the centre of the UK's biggest data breach incident in November 2007. The child benefit records of 25 million people placed on two computer discs were lost in the post.

Now, for the first time there is a new safeguard: Altronus

Altronus is a revolutionary Data Protection system developed by Datatecnics.

The Altronus software introduces to the market for the first time a self destructing data technology.

If one of your employees loses a laptop on the tube, train or a taxi, Altronus will protect it.

If a confidential e-mail does not reach a recipient, Altronus will protect it.

If your network is attacked and data is stolen, Altronus will protect it.

If any employee leaves organisation with unauthorised data, Altronus will protect it.

Altronus is a cutting edge software solution which will automatically destroy data, based on pre defined instructions by the user. These trigger scenarios can vary from an attempt to send the data files by email which fail to reach its target recipient, to a stolen laptop with confidential files.

Altronus® delivers the next generation of Data Protection tools

Altronus introduces a new generation of Data Protection tools designed by Datatecnics to safeguard your data on your laptop computer or other mobile devices.

The application works like no other software security system currently available.

Altronus Self Destructing Software is based on an Artificial Intelligent Based-Human Behavioural System or AIBHBS. In simple terms this is a self learning system which adapts to the way an organisation or individual uses data. By evolving and adapting Altronus is the best possible system to prevent your data files from falling in the wrong hands.

Most data breaches and losses are through unauthorised data theft from personal computers; lost laptops or unauthorised emails of files.

Altronus data protection methods are totally unique, the system provides the ultimate protection by self destructing the data if security breaches are triggered.

Based on your specific criteria Altronus will protect your valuable data as per your instruction.

If your computer is stolen, Altronus activates a protection system which triggers one of several actions including self destruction of the data or the entire system (for example disabling all critical processes including the hard disk and CPU.) The assigned or responsible individual will receive an SMS notification on completion.

How does it work?

- 1 Altronus is installed quickly, easily and securely, direct from the web to your computer.
- 2 Once installed, Altronus will provide you with your own personalised Control Panel. This enables you to tailor your hardware and software files to the way your system needs to be protected.
- 3 Finally in the security panel you can instruct Altronus on what actions you would like the system to take in the event of a security breach.

That's it - you have now fully protected your hardware and software from whole range of threats.

Technical Data

Data Platforms	Windows, SQL Server
Memory Requirements	1GB
Storage HD	5GB
CPU	-
